

Ninja Live Readiness Sanity Report

Generated 2026-05-14 11:29 ET from C:\Users\conor\luke

File-level verdict: 13/13 checks pass. The local code/install/workspace/level inputs are set for LukeNativeShadowStrategy to run exact-account guarded on APEX752020000018 and load 2026-05-14 Mancini levels from the central event CSV.

Runtime boundary: NinjaTrader GUI compile/reload has not been observed after this patch; runtime proof requires ENGINE_READY then LEVELS_LOADED source=central_events_csv. This is the remaining operator/Ninja GUI boundary, not a source-file uncertainty.

Why This Should Work This Time

Failure Mode From Earlier	Current Control	Evidence
Stale 5/11 level file could drive today.	Native now tries artifacts/research/mancini-context-protocol/events.csv by chart futures session before falling back to text.	TryLoadCentralManciniLevels + source=central_events_csv
Workspace could reload old account/autonomy gates.	Saved workspace strategy block is LiveGuarded , AllowLiveAccounts=true , exact APEX752020000018 .	{"AutonomyMode":"LiveGuarded","ManciniEventCsvPath":"C:\\Users\\conor\\luke\\artifacts\\research\\mancini-context-protocol\\events.csv","AllowLiveAccounts":"true","AllowedAccountName":"APEX752020000018","NativeQuantity":"2","MaxQuantity":"2","MaxMarketableEntryPoints":"0.25","AllowHistoricalBacktestOrders":"false"}
Historical processing could submit strategy orders before realtime.	Saved workspace and source default keep AllowHistoricalBacktestOrders=false .	AllowHistoricalBacktestOrders=false
Installed Ninja copy might lag repo.	Repo and installed Native strategy hash match exactly.	28E781556301FF133C628503270CC28BF6E18E7E3B91ABD31C29A3F7A93589B7
Order path might be blocked by removed bridge behavior.	Native uses managed Ninja calls: preloaded stop/target, then EnterLongLimit , same viable order model as the old bridge path.	SetStopLoss / SetProfitTarget / EnterLongLimit(qtyT1, orderEntry, ...)

Evidence Checklist

Status	Check	Evidence
PASS	Installed Native equals repo	28E781556301 repo / 28E781556301 installed

Status	Check	Evidence
PASS	Installed Analyzer unchanged and equal	AEE03AA6D186 repo / AEE03AA6D186 installed
PASS	Native source gate clean	blockers=0
PASS	Native install dry-run clean	target_same=true, actions=0
PASS	Analyzer install dry-run clean	target_same=true, actions=0
PASS	Central Mancini source wired in source	central CSV is loaded before text fallback
PASS	Level file is current session	target=2026-05-14, trade_count=48, first=7111, last=7467
PASS	Required posted levels present	7467, 7455, and 7111 all present
PASS	Workspace exact APEX guarded	LiveGuarded, true, APEX752020000018
PASS	Workspace historical orders disabled	AllowHistoricalBacktestOrders=false
PASS	Managed order path still present	preload bracket then EnterLongLimit
PASS	Broad/unmanaged order calls absent	no SubmitOrder/SubmitOrderUnmanaged/short calls
PASS	Analyzer manual post-bar exits still banned	banned Analyzer exit strings absent

Current Levels

Source: artifacts/research/mancini-context-protocol/events.csv

Target: 2026-05-14

Trade levels: 48, range 7111 to 7467

Hash: 32EF2A80B95CF0264A23B5BC763659FA83356990D612
EE27C871D6A54B4C8EB9

Install State

Native install dry-run:

target_same=true, actions=0

Analyzer install dry-run:

target_same=true, actions=0

Focused tests: 5 files passed, 19 tests passed

Runtime Acceptance Criteria

After NinjaScript compile and strategy reload, the first valid runtime proof should be these telemetry rows in C:\Users\conor\luke\state\events\ninja-native-shadow.jsonl :

ENGINE_READY	mode should be LiveGuarded, account should be APEX752020000018, guard should say exact APEX.
LEVELS_LOADED	must include source=central_events_csv, count=48, target_session=2026-05-14, chart_session=2026-05-14.
ORDER_SUBMITTED	only after the existing signal math fires; order entry must pass the 0.25-point marketable-entry guard and flat-position guard.

Hostile Audit

Question	Answer
Can this still trade stale 5/11 levels?	No by source design: central CSV is checked first by chart session. Text fallback is current 5/14 as of this report.
Can a broad live account pass?	No. LiveGuarded requires AllowLiveAccounts=true and exact string match to APEX752020000018 .
Can historical Analyzer math be mistaken for live proof?	The report does not use Analyzer PnL as proof. It requires Native realtime telemetry after compile/reload.
Can I honestly say Ninja has compiled and reloaded this exact installed file?	No. That has to happen in the Ninja GUI. File hashes and install state are proven; GUI compile/reload is the remaining boundary.
Can I honestly say the next signal will be profitable?	No. The claim is only that the implementation/input/gates are aligned to fire when the existing math confirms a setup.
